ABSTRACT

This publication reports demographic data describing the population of examinees who took the Graduate Management Admission Test (GMAT) during the administration year October 1980 through July 1981. This information was obtained from examinee responses to the nine-item Biographical Information Questionnaire, other information on the 1980-81 registration form and test scores from the examinee records. The non-mandatory questionnaire requested information about the examinees' citizenship, residence, primary language, subgroup affiliation, work experience, age and sex. Three types of demographic information were gathered from the examinees: geographic data, academic data and biographical data. Data from the 214,555 records of examinees who took the GMAT at one or more of the four administrations during 1980-81 are summarized in the thirty-seven tables included in this report. (PN)

## Introduction

This publication reports demographic data describing the population of examinees who took the Graduate Management Admission Test (GMAT) during the administration year October 1980 through July 1981. This information was obtained from examinee responses to the nine-item Biographical Information Questionnaire, other information on the 1980-81 registration form and test scores from the examinee records. It was not mandatory for examinees to respond to biographical information questions to register for the examination. The registration instructions stated: "It is not required that you answer these questions; however, by answering them you will add descriptive information about yourself to the GMAT report sent to schools you designate on the registration form." The questionnaire requested information about the examinees' citizenship, residence, primary language, subgroup affiliation, work experience, age and sex. Examinees were informed that responses to questions about language and ethnicity "[would] not be reported to any school on an individual basis." Data from the 214,555 records of examinees who took the GMAT at one (or more) of the four administrations during 1980-81 are summarized in the thirty-seven tables included in this report[1]. (Analyses of repeater data have showed considerable consistency in repeater rates across subgroups.)

[1] Because analyses presented in this publication are based on test records rather than on examinees, any examinee who took the GMAT more than once during 1980-81 is represented in the analyses by the number of times he/she took the test. The actual number of examinees for any group can be expected to be approximately 10-15% less than the number of examinee records that are analyzed.

## General Characteristics of GMAT Examinees

Three types of demographic information were gathered from the 1980-81 examinees: geographic data, academic data and biographical data. Geographic data provided information about citizenship and place of residence. The majority of examinees were from the United States, but it can be seen from Figure 1 (data taken from Table 1) that GMAT examinees spread across the world. Seventy three percent of the examinees were from the United States. The next largest concentrations came from Canada and Southeast Asia, but each contributed only 3.6% of the total number of examinees.

Figure 2 (data taken from Table 3) demonstrates that, among GMAT examinees who were U.S. residents, the greatest concentrations at the state level were from New York, California and Illinois. The geographic region with the highest concentration of examinees was the Middle Atlantic states.

Academic data pertaining to GMAT examinees provided information about their undergraduate majors and undergraduate grade-point averages (UGPAs). The distribution of the undergraduate major areas of the 1980-81 GMAT examinee population is illustrated in Figure 3 (data taken from Tables 8 and 9). The majority of the examinees pursued business-related majors as undergraduates; the smallest proportion majored in the humanities areas. Figure 4 (data taken from Table 8) illustrates a more detailed breakdown of examinee distribution within each of the undergraduate major areas. From this figure it is apparent that there were demonstrable differences among specific majors within the broader disciplines of humanities, science, social science and business/commerce.

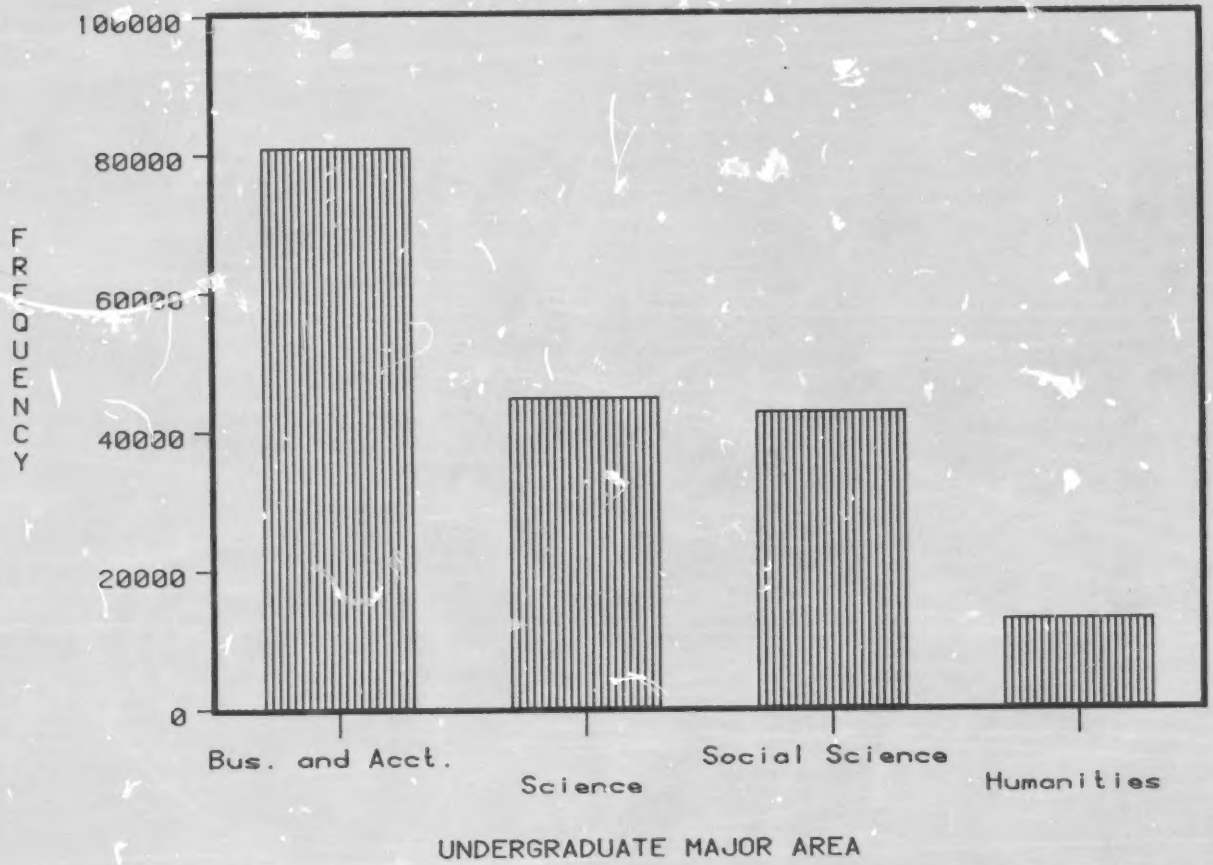
Figure 3

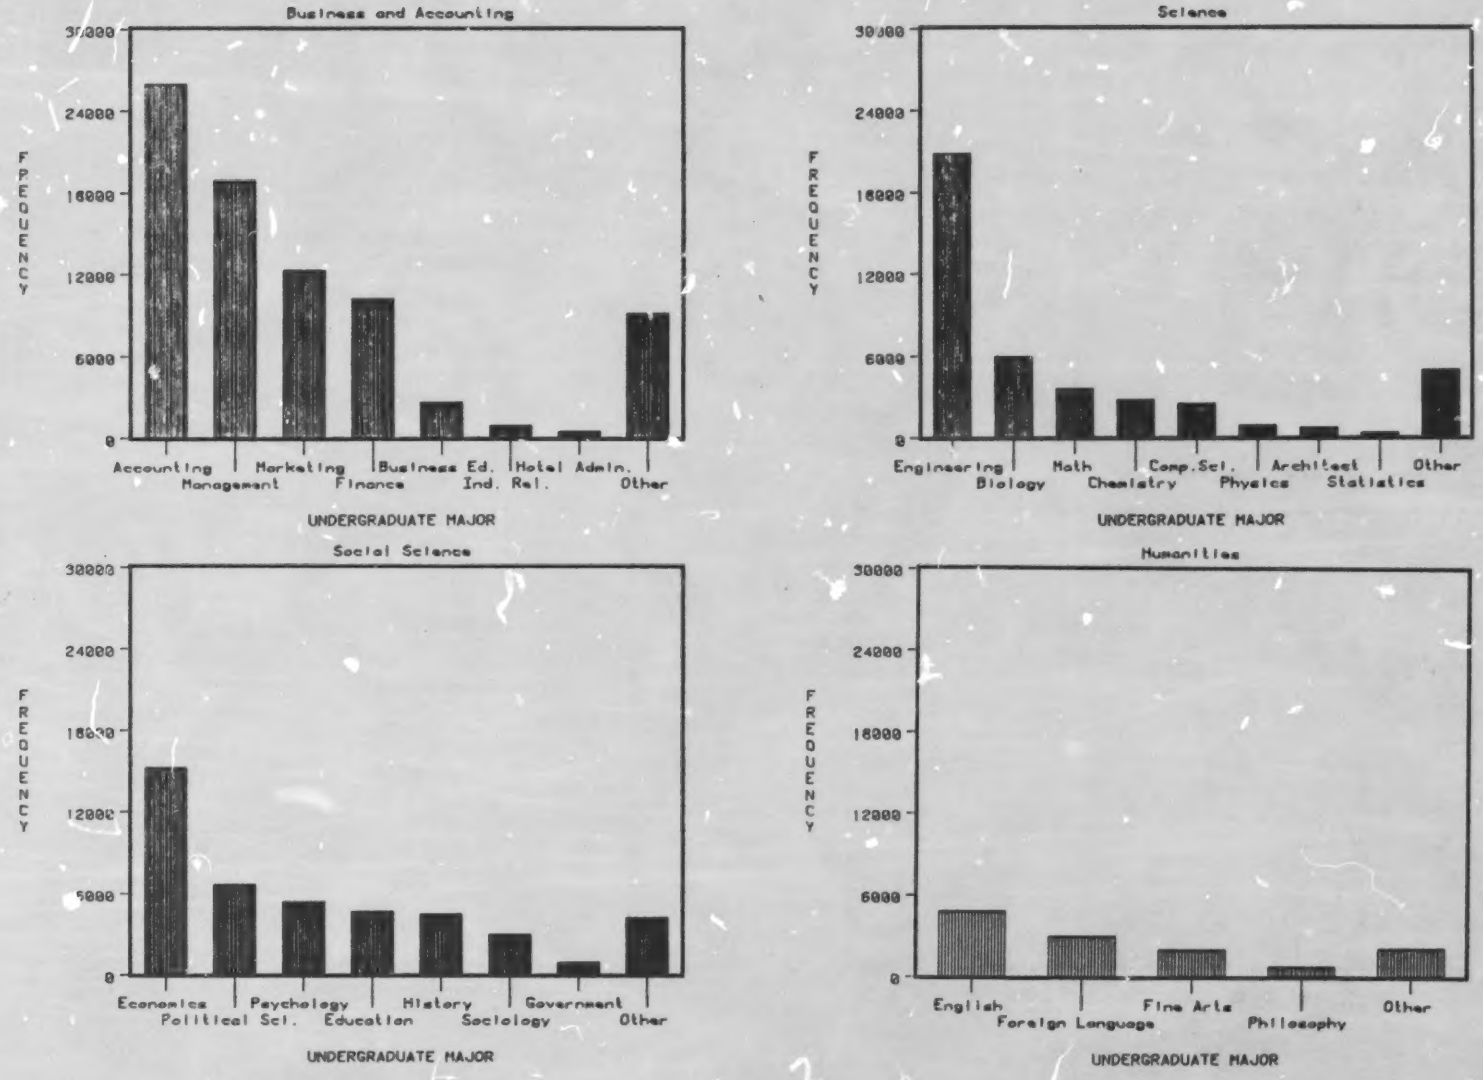
Frequencies of Undergraduate Major Areas



1980-81 GMAT Demographic Profile

Figure 4

Frequencies of Undergraduate Majors



1980-81 GMAT Demographic Profile

Approximately one-quarter of the examinees whose undergraduate majors were in the business areas majored in accounting. Likewise, approximately one-fourth of the social science majors specialized in economics, while one-third of the science majors were engineers.

The distributions of undergraduate grade point averages among GMAT examinees are presented separately for males and females in Figure 5 (data taken from Table 10). Approximately two-thirds of the examinees were male. The largest number of examinees fell at or between grade point averages of 3.0 and 3.75. The concentration trailed off as grade point averages decreased to 2.0. It is also interesting to note that the percent of males exceeded the percent of females for grade point averages less than 3.1, but the percent of females exceeded the percent of males for UGPAs between 3.1 and 4.0.

Biographical data included information about the sex, age and U.S. population subgroup membership of the 1980-81 examinees. The age distribution is illustrated in Figure 6. GMAT examinees ranged from less than 20 to more than 50 years old. Almost half were between 22 and 25 years of age; three-fourths were between 22 and 30.

Figure 5

Undergraduate Grade Point Average by Sex

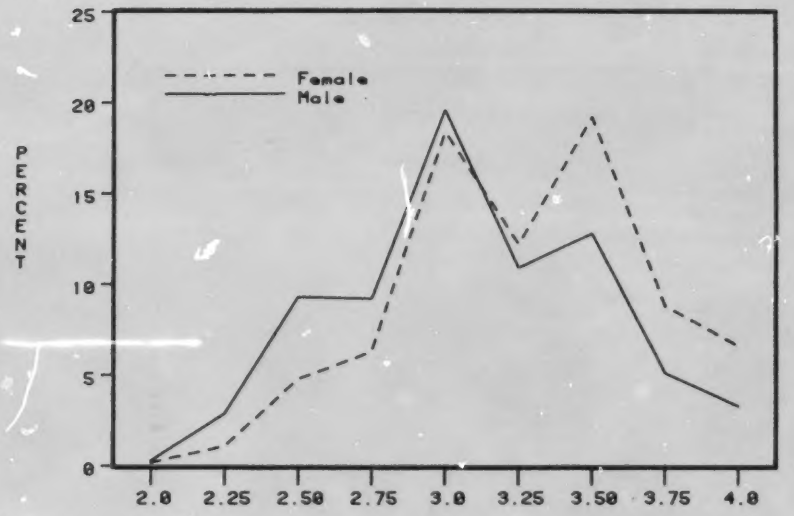


Figure 6

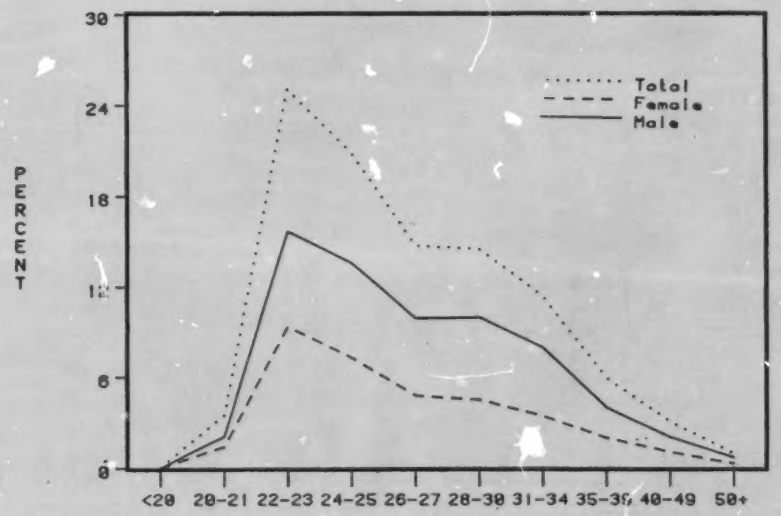
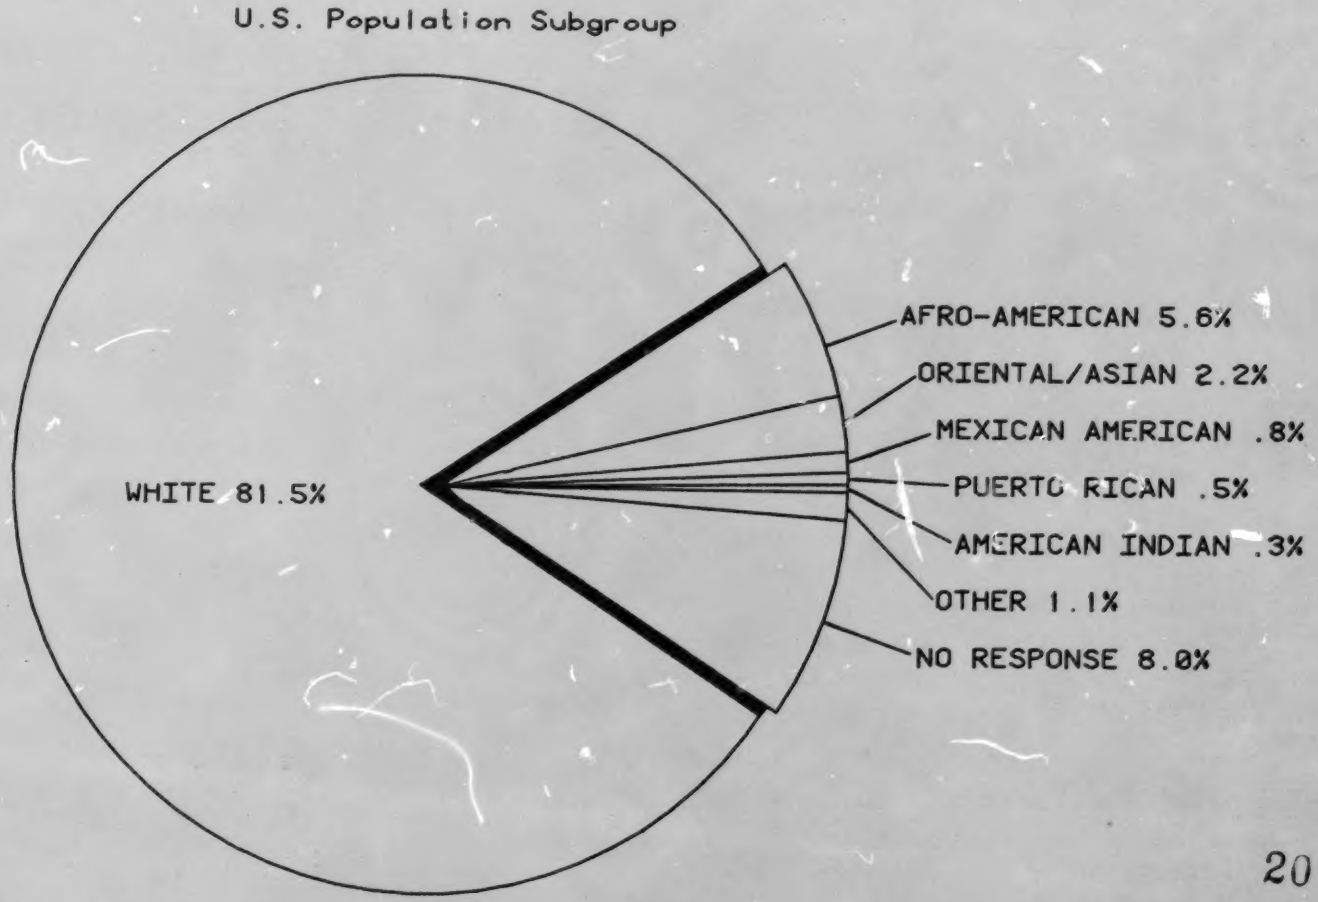
Age Distribution by Sex



Examinees who were U.S. citizens were asked to specify to which of the following groups they belonged: American Indian, Black/Negro/Afro-American, Caucasian/White, Mexican American/Chicano, Oriental/Asian, Puerto Rican, or Other. They were also given the option "I do not care to respond," which was chosen by 8% of those who answered this question. Figure 7 represents the U.S. population subgroup distribution of GMAT examinees. The majority, 81.5%, belonged to the Caucasian/White subgroup.

Figure 7



## How to Read the Tables

The first 17 tables presented in this report are two-way crosstabulation tables. Each of these tables presents simultaneous frequencies of examinees on a pair of variables. Summary information for each category of the variable listed across the top of the table can be found in the row labeled COLUMN TOTAL. Likewise, summary information for each category of the variable listed down the left hand margin can be found in the column labeled ROW TOTAL. For each category, the summary information consists of a pair of numbers. The first number is the frequency (i.e. count) of the examinees accounted for in that category. The second number is the percentage of the total number of examinees that the category frequency represents.

As an example, consider Table 1, excerpted on the right. The rows of this table indicate the regions of the world from which the examinees came and the columns indicate the age groups, in years, to which the examinees belonged. The first pair of numbers in the ROW TOTAL column are 156,684 and 73.0. Thus, 156,684 is the number of examinees who were from the United States. That number represents 73.0% of the total 214,555 examinees.

The pairs of numbers in the COLUMN TOTAL row reveal the same information for the columns. For example, 7,609 is the number of examinees who were between 20 and 21 years of age and these examinees represent 3.5% of the total number of examinees.

Within the boxes in the table, the numbers provide information about the crosstabulation between the two variables. In Table 1, the crosstabulation is between

| COLUMN TOTAL | 99<br>0.0 | 7609<br>3.5 | [illegible]2<br>3.0 | 2003<br>0.9 | 214555<br>100.0 |

world region and age in years. For example, information about examinees from the world region designated "Canada" who were 20 or 21 years of age can be obtained by examining the box that is in both the row labeled Canada and the column labeled 20-21. Three numbers are in that (and every) box. The first is the number of examinees who coincidentally fell into the two categories, the second is the number expressed as a percentage of the ROW TOTAL and the third is the number expressed as a percentage of the COLUMN TOTAL. In the example under consideration, 284 examinees were both from Canada and between 20 and 21 years of age. These 284 examinees were 3.7% of the 7,759 examinees from Canada and 3.7% of the 7,609 examinees who were 20 or 21 years of age. All subsequent crosstabulation tables presented in this report can be read in the same manner.

Tables 18 through 31 provide means and standard deviations (an indicator of the variability of the scores) for GMAT scores for examinees who were categorized according to various geographic, academic, and personal characteristics. These tables also report the number of examinees in each of the categories.

Again, the ROW TOTAL column provides summary statistics for the categories of the variable listed down the left-hand column and the COLUMN TOTAL row provides summary statistics for the categories of variables listed across the top of the table. In these tables each category consists of three numbers. The first number is the mean (or average) GMAT score for all the examinees falling into that category, the second is the total number of examinees, and the third is the standard deviation of the GMAT scores for the examinees in the category. As an example, consider Table 19 (excerpt shown below). The mean GMAT Total score for examinees from Southeast Asia was 412.11, with a standard deviation of 96.39. These statistics were obtained from the 7,681 examinees from Southeast Asia.

The means, frequencies, and standard deviations for the intersection between the two variables can be read from the corresponding boxes in the table. Again, considering Table 19, the mean GMAT Total score for humanities majors from the United States was 500.04, with a standard deviation of 96.81. These statistics were obtained from the scores of the 11,164 examinees who were both humanities majors and from the United States.

Excerpt of Table 19

GMAT Total Score Summary Statistics by World Region and Under

| | Major Group | | | |
|---|---|---|---|---|
| MEAN / COUNT / STD DEV | Humanities | Social Science | S | ROW TOTAL |
| World Region | | | e | |
| | 500.04 | 486.[illegible] | 75.47 | 478.14 |
| U.S.A. | 11164 | 36[illegible] | 1563 | 156684 |
| | 96.81 | [illegible] | 106.92 | 99.25 |
| | 514.87 | [illegible] | 501.75 | 504.47 |
| Canada | 378 | [illegible]1 | 212 | 7759 |
| | 88.[illegible] | [illegible]9.37 | 94.28 | 90.97 |
| | [illegible] | 393.77 | 395.59 | 412.11 |
| Southeast Asia | [illegible] | 382 | 202 | 7681 |
| | [illegible] | 91.93 | 93.61 | 96.39 |
| | [illegible].65 | 402.97 | 428.23 | 418.65 |
| Pacific Islar | 1984 | 249 | 96 | 4627 |
| | 93.78 | 94.57 | 96.84 | 94.05 |

Tables 32 through 37 provide percentile ranks for selected GMAT scores for various groups of examinees. For any particular score, percentile rank is used to specify what percent of the examinees fell below that score. For example, consider the Total score of 600 in Table 32, excerpted below. It can be seen that 87.8% of the 156,684 examinees from the United States scored lower than 600, as did 84.6% of the examinees from Canada, 96.6% from Southeast Asia, 96.7% from the Pacific Islands, etc.

Excerpt of Table 32

Percent of Candidates Falling Below Selected GMAT Total

| Total Score | United States | Canada | S.E. Asia | Pacific Islands | Europe |
|---|---|---|---|---|---|
| 800 | 100.0 | 100.0 | 100.0 | 100.0 | 99.9 |

## Summary of Data From Crosstabulation Tables[2]

### Geographic Representation

Tables 1 through 3 provide geographic information about GMAT examinees. Table 1 shows a crosstabulation between the major regions of the world[3] from which 1980-81 GMAT examinees came and the ages of the examinees. It can be seen that examinees from some foreign regions tended to be slightly older than examinees from the United States. For example, approximately 20% of the examinees from the Pacific Islands, Southeast Asia, and Australia were between 28 and 30 years of age, compared to 13.8% of the U.S. examinees.

Table 2 provides more detailed information by breaking down the world regions into the specific countries of citizenship of the examinees, while also examining the sex of the examinees from each country. Table 2 is again dominated by the 73% of the examinees who came from the United States. However, it is interesting to note that the other 57,871 examinees represented more than 130 additional countries. Table 2 also shows that approximately two-thirds of the examinees (65.9%) were male. Among the examinees who were not from the United States,

[2] Of the thirty-seven tables in this report, twenty-two are based on all 214,555 examinees, thirteen are based on 156,591 examinees who were U.S. citizens and two (Tables 11 and 17) are based on other defined subsamples of the total group. Of the 156,864 examinees who reported they were U.S. citizens on the registration form, 93 responded that they were "Not U.S. citizens" to the question concerning population group membership. These 93 examinees were not included in the tables for "U.S. Citizens Only."

[3] A listing of the countries defining the world regions is on page 22.

74.2% were male and only 25.8% were female; U.S. examinees included 62.8% males and 37.2% females. For many countries, the percentages are based on relatively few examinees. Among countries having 100 or more examinees, Jamaica, Taiwan, Thailand, and the Philippines had between 40 and 50% who were female.

Table 3 further categorizes examinees who were from the United States, the country represented by the majority of the examinees, according to the states in which they were residing. It can be observed from Table 3 that the proportions of male and female candidates were fairly similar across all the states.

## U.S. Population Subgroups

Tables 4 and 5 summarize characteristics of U.S. citizens by ethnic/cultural subgroups. It is interesting to note in Table 4 (sex by subgroup) that of the Afro-American/Black and Oriental/Asian examinees, approximately half were male and half were female, while all the other U.S. subgroups distributed approximately two thirds male and one third female, as did the entire 1980-81 GMAT examinee population.

Table 5 crosstabulates the age of the examinees with the U.S. population subgroup to which they belonged. The proportion of examinees from each age group category was very stable across the subgroups. That is, almost half the examinees were between 22 and 25 years of age and three-fourths were between 22 and 30 for all subgroups.

## Primary Language

GMAT examinees came from more than 130 different countries and eight different subgroups within the U.S. Tables 6 and 7 summarize information concerning the languages in which these examinees were most fluent. As might be expected, English was the dominant language spoken by GMAT examinees. Among the candidates whose primary language was not English, it can be seen that Spanish, Chinese, and French were the most frequently cited primary languages.

Table 7 crosstabulates the primary language with self-reported score on the Test of English as a Foreign Language (TOEFL) for nonnative-English-speaking examinees. Examinees who had not taken TOEFL in the previous two years were combined with students who chose not to respond to the request for TOEFL score. The counts for these examinees are reported in the last column of the table, labeled "No Response." Ninety-one percent of the nonnative-English-speaking examinees did not report TOEFL scores. Among those who did respond, almost 90% scored 500 or higher.

## Undergraduate Academic Data

Tables 8 through 11 summarize undergraduate academic information pertaining to 1980-81 GMAT examinees. Tables 8 and 9 are concerned with undergraduate majors. Undergraduate major is crosstabulated with U.S. population subgroup and sex, respectively.

The proportion of male and female examinees varied across undergraduate majors. Approximately 78% of the science majors and 69% of the business majors were male,

while only 59% of the social science and 41% of the humanities majors were male.

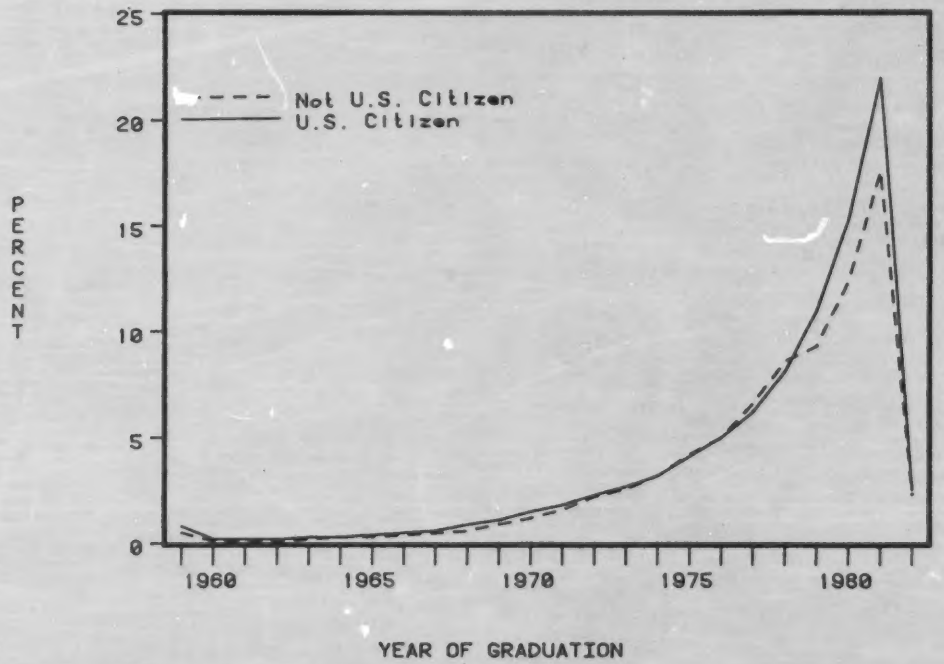
Tables 10 and 11 present data on undergraduate grade point averages for male and female examinees and for U.S. population subgroups, respectively. Except for grades less than 2.0, the percentage in each category who were female consistently increases with each higher level of grades. Nearly 80% of examinees with undergraduate grade point averages less than or equal to 2.5 were males. The distribution of UGPA across each of the population subgroups was similar to the total distribution for U.S. citizens only. Additionally, the distribution for U.S. citizens only was very close to the distribution for all candidates.

Work Experience

Tables 12 through 14 address the work experience characteristics of the examinees. Table 12 categorizes both foreign and domestic examinees according to the year in which they graduated from college. Nearly 50% of the examinees graduated between 1979 and 1981. Figure 8 demonstrates that the shape of the distribution was similar for foreign and domestic examinees when these groups were considered separately.

Figure 8

Year of Graduation by Domestic/Foreign



It can be seen from Table 13 that almost 20% of the examinees had less than one year of work experience. Another 20% had one or two years and, as years of experience increased, the percent of examinees was consistently smaller. The data in this table are consistent with data pertaining to age of examinees, reported in Tables 1 and 5, and to year of graduation, reported in Table 12. The proportion of males to females was consistent with the total group proportion in all work experience categories except "More Than Ten." Among the examinees reporting more than ten years of work experience, 97.1% were male.

Table 14 is a crosstabulation of work experience and subgroup membership for examinees who were U.S. citizens only. The proportion of examinees in each experience category for each subgroup was fairly consistent with the proportions found for the total group.

Intended Graduate Study

Tables 15 through 17 present data pertaining to full-time/part-time student status anticipated by the examinees. A much higher percentage of foreign examinees anticipated full time study than did U.S. examinees, although Canada and Australia were exceptions. That is, approximately 38% of the examinees from the United States indicated intentions of full-time graduate study, compared to 75% of examinees from other world regions. Table 16 summarizes intended graduate study for U.S. citizens across subgroups. Intended graduate study did not appear to differ among subgroups. The age distributions indicate that examinees considering full-time graduate study tended to be younger than those considering part-time study. Tables 17a and 17b crosstabulate sex and age group for those intending full- and part-time graduate study.

Summary of Data from Tables of GMAT Scores

Table 18 presents means and standard deviations for GMAT Total, Verbal, and Quantitative scores classified by World Region. Tables 19 through 21 then present means and standard deviations for GMAT Total, Verbal, and Quantitative scores for the crosstabulation of world region with undergraduate major area. The tables suggest that mean scores for examinees from non-English-speaking countries tended to be lower than for examinees from English-speaking countries on the Total GMAT and on the GMAT Verbal section. However, the means did not tend to be lower on the GMAT Quantitative section. This can be seen in Figures 9 to 11, which also highlight differences in performance among examinees from the different undergraduate major areas. Science majors performed the best on Quantitative and Total; humanities majors tended to score highest on the Verbal section. Examinees whose undergraduate majors were in the business/commerce areas tended to have lower mean scores than examinees from the other undergraduate major areas studied. Tables 22 through 24 compare GMAT scores for males and females in specific undergraduate majors within the broader areas presented in Tables 19 through 21.

Tables 25 through 27 present mean scores for the undergraduate majors for each of the U.S. population subgroups. As can be seen from Figures 12 to 14, differences in GMAT scores among the subgroups seemed to be fairly consistent across the various undergraduate majors as well as for Verbal, Quantitative and Total scores. Caucasian/White examinees from each of the four major areas had the highest mean while examinees from the Afro-American and Puerto Rican subgroups had the lowest.

1980-81 GMAT Demographic Profile

Table 28 presents Verbal, Quantitative and Total GMAT scores for different language groups. The language groups are presented in decending rank order according to the number of examinees who designated each language as their primary language. Examination of Figure 15 (taken from Table 28) suggests that there is little variation in performance on the overall GMAT across the different language groups. However, Figure 16 highlights differences in performance between the Verbal and Quantitative sections by some examinees whose primary language was not English. Mean Verbal and mean Total scores were highest for English-speaking examinees. These were most closely followed by scores of French- and German-speaking examinees. Mean Quantitative scores for five non-English-speaking groups exceeded the mean score of the English-speaking examinees. The highest Quantitative scores were earned by Korean-, Chinese-, and Japanese-speaking examinees, in that order.

Figure 15

Mean Total Scores by Primary Language

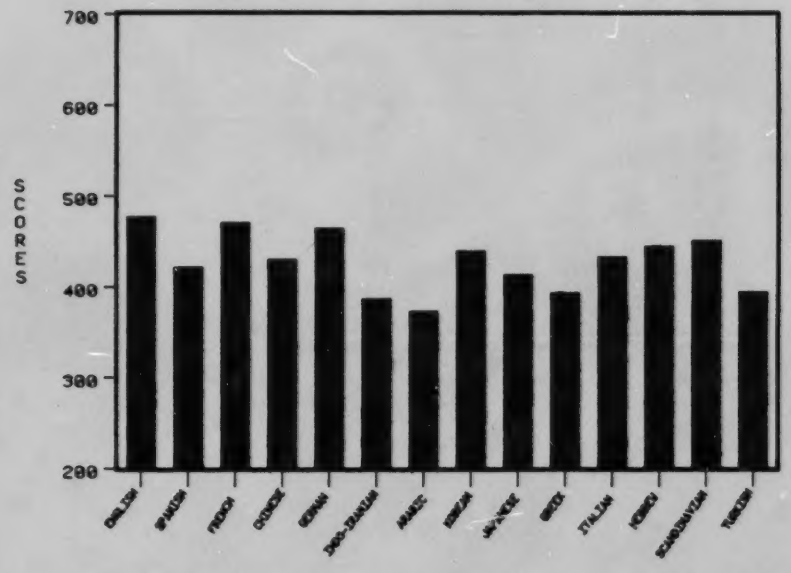

Figure 16

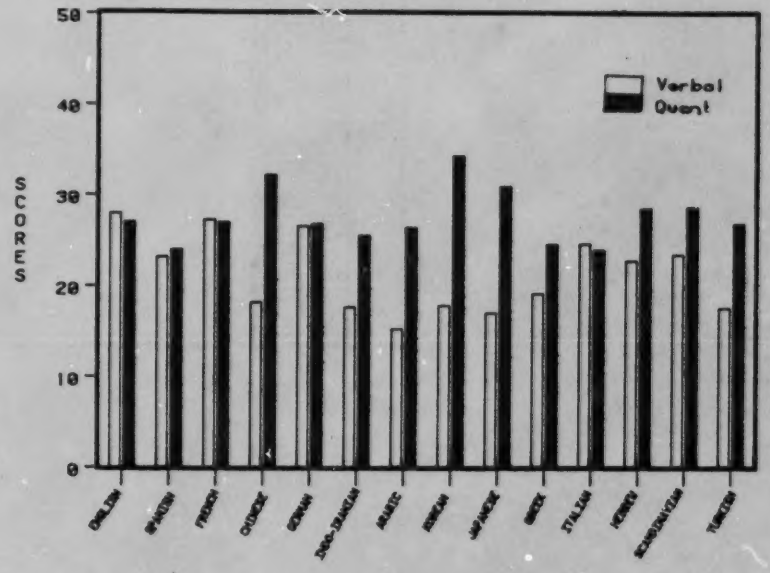
Mean Verbal and Quantitative Scores by Primary Language



GMAT mean scores for males and females by age are presented in Tables 29 through 31 and Figures 17 to 19. Among younger examinees, mean Total score for males exceeded mean Total score for females. However, after age 25, this trend reversed. Females' mean Verbal scores were consistently higher than males' mean Verbal scores; the difference seemed to increase with age. For all age groups, males' mean Quantitative scores were always higher than females' mean Quantitative scores and the relative distance between them appeared constant.

## Summary of Data from Percentile Rank Tables

Tables 32 through 37 provide percentile ranks for selected GMAT scores. Tables 32 through 34 present Total, Verbal, and Quantitative score percentile ranks, respectively, for examinees from the eleven world regions as well as for examinees who did not respond with their country of citizenship. A comparison can be made across these twelve groups by choosing any score point and reading across the table to determine what percentage of examinees from each group scored lower than that point. The greater the percentage, the lower the group scored relative to the other groups. For example, only 45% of the examinees from Canada received Total scores lower than 500 (Table 32), while 94% of the examinees from Africa received lower scores. Examinees from Canada, the United States, and Australia achieved the highest Total scores; examinees from Africa, Mexico and Eastern Mediterranean achieved the lowest scores.

Tables 35 through 37 present separate percentile ranks for males and females from each of the U.S. population subgroups. On the average, both male and female examinees from the Afro-American/Black and the Puerto Rican subgroups received the lowest Verbal, Quantitative and Total GMAT scores. White examinees seemed to earn the highest scores, on the average. Differences between males and females were consistent with those found in the entire population and are presented in Figures 17 to 19.
